

Supplement with Liquid Diets

Drs. Foster & Smith Educational Staff

Liquid marine foods are a viable and convenient supplementary diet for corals and invertebrates when used properly. They offer nutritional variety for a more complete diet and provide a more natural form of food for your marine aquarium inhabitants.

minuscule organisms offer maximum nutrition

[Liquid foods](#) are available in a variety of formulations to suit different species with different feeding habits. These diets provide inhabitants such as corals and invertebrates with a more natural form of food. Some of the more popular selections of liquid diets available include Phytoplankton, Zooplankton, and a combination of the two.

[Phytoplankton](#) are tiny plant life best suited for herbivores and filter feeders such as feather dusters, scallops, clams, and gorgonians. Typically they are from 5 μ m to 25 μ m in size. As food for zooplankton, they help establish the food chain in the reef aquarium. Phytoplankton is available in a number of products, such as [PhytoMax Expert Series Phytoplankton](#) which comes with a dropper to avoid overdosing.

[Zooplankton](#) are minute animal life (larval stages of crustaceans and other invertebrates) and tend to be 250 μ m to 800 μ m in size. Zooplankton are ideal for carnivores such as soft and stony coral, zooanthids, mushroom corals, anemones, shrimp, and crabs. [Zooplanktos-M](#) is a concentrated suspension of copepods (zooplankton) that does not require refrigeration.

To appeal to a larger variety of filter feeding species, consider a combination food such as [Coral Plankton](#) which is comprised of both phytoplankton and zooplankton and comes equipped with a calibrated dosing pump for precise feedings.

feed with care

Because liquid foods are concentrated and easy to dispense, overfeeding is

Q Why are liquid foods considered to be a supplementary diet?

A. Because there is no single food - no "magic formula" - that can provide all of the nutrients your various fishes need in one single form. Use a staple diet, a supplemental liquid diet, and vitamin and nutritional supplements as needed to ensure your fish receive all the nutrients necessary for good health.

common. Feed sparingly and target feed with [droppers](#) or [pipettes](#) when necessary. Uneaten food will break down and compromise water quality. Determine the dietary requirements of your particular invertebrates and follow a specific feeding regimen to maximize the benefits of liquid food and to ensure healthy water conditions.
